D-finite Functions

Definition: A function $f(x)$ is called **D-finite** if it satisfies a linear ordinary differential equation with polynomial coefficients:

$$p_r(x)f^{(r)}(x) + \cdots + p_1(x)f'(x) + p_0(x)f(x) = 0,$$

$p_0, \dots, p_r \in \mathbb{K}[x]$ (not all zero).

D-finite Functions

Definition: A function $f(x)$ is called **D-finite** if it satisfies a linear ordinary differential equation with polynomial coefficients:

$$p_r(x)f^{(r)}(x) + \cdots + p_1(x)f'(x) + p_0(x)f(x) = 0,$$

$p_0, \dots, p_r \in \mathbb{K}[x]$ (not all zero).

Definition: A sequence a_n is called **P-recursive** if it satisfies a linear recurrence equation with polynomial coefficients:

$$p_r(n)a_{n+r} + \cdots + p_1(n)a_{n+1} + p_0(n)a_n = 0,$$

$p_0, \dots, p_r \in \mathbb{K}[n]$ (not all zero).

$p_0, \dots, p_r \in \mathbb{K}[n]$ (not all zero).

- ▶ In both cases, one needs only **finitely many** initial conditions.
- ▶ a_n is P-recursive if and only if $f(x) = \sum_{n=0}^{\infty} a_n x^n$ is D-finite.

D-finite Functions

Definition: A function $f(x)$ is called **D-finite** if it satisfies a linear ordinary differential equation with polynomial coefficients:

$$p_r(x)f^{(r)}(x) + \cdots + p_1(x)f'(x) + p_0(x)f(x) = 0,$$

$p_0, \dots, p_r \in \mathbb{K}[x]$ (not all zero).

- ▶ In both cases, one needs only **finitely many** initial conditions.
- ▶ a_n is P-recursive if and only if $f(x) = \sum_{n=0}^{\infty} a_n x^n$ is D-finite.
- ▶ Equivalently, such functions/sequences are called **holonomic**.

Differential Equations and Recurrences

Example: The **Bessel function** $J_\nu(x)$ describes the vibrations of a circular membrane and other phenomena with cylindrical symmetry.

Differential Equations and Recurrences

Example: The **Bessel function** $J_\nu(x)$ describes the vibrations of a circular membrane and other phenomena with cylindrical symmetry.

- ▶ Bessel differential equation:

$$x^2 \frac{d^2}{dx^2} J_\nu(x) + x \frac{d}{dx} J_\nu(x) + (x^2 - \nu^2) J_\nu(x) = 0$$

Differential Equations and Recurrences

Example: The **Bessel function** $J_\nu(x)$ describes the vibrations of a circular membrane and other phenomena with cylindrical symmetry.

- ▶ Bessel differential equation:

$$x^2 \frac{d^2}{dx^2} J_\nu(x) + x \frac{d}{dx} J_\nu(x) + (x^2 - \nu^2) J_\nu(x) = 0$$

- ▶ Recurrence equation:

$$J_\nu(x) = \frac{2(\nu - 1)}{x} J_{\nu-1}(x) - J_{\nu-2}(x)$$

Differential Equations and Recurrences

Example: The **Bessel function** $J_\nu(x)$ describes the vibrations of a circular membrane and other phenomena with cylindrical symmetry.

- ▶ Bessel differential equation:

$$x^2 \frac{d^2}{dx^2} J_\nu(x) + x \frac{d}{dx} J_\nu(x) + (x^2 - \nu^2) J_\nu(x) = 0$$

- ▶ Recurrence equation:

$$J_\nu(x) = \frac{2(\nu - 1)}{x} J_{\nu-1}(x) - J_{\nu-2}(x)$$

Many special functions can be characterized as solutions to systems of linear differential equations and recurrences, and in fact are D-finite (holonomic).

Finiteness Property

Example: The **Legendre polynomials** are orthogonal polynomials w.r.t. the L^2 inner product $\int_{-1}^1 f(x)g(x) dx$, and satisfy the ODE

$$(x^2 - 1)P_n''(x) + 2xP_n'(x) - n(n + 1)P_n(x) = 0.$$

Application

Finite Elements

(joint work with Joachim Schöberl and Peter Paule)

Problem Setting

Simulate the propagation of electromagnetic waves according to

$$\frac{dH}{dt} = \text{curl } E, \quad \frac{dE}{dt} = -\text{curl } H \quad (\text{Maxwell})$$

where H and E are the magnetic and the electric field respectively.

Problem Setting

Simulate the propagation of electromagnetic waves according to

$$\frac{dH}{dt} = \text{curl } E, \quad \frac{dE}{dt} = -\text{curl } H \quad (\text{Maxwell})$$

where H and E are the magnetic and the electric field respectively.

Define basis functions (2D case):

$$\varphi_{i,j}(x, y) := (1-x)^i P_j^{(2i+1,0)}(2x-1) P_i\left(\frac{2y}{1-x} - 1\right)$$

using Legendre and Jacobi polynomials.

using Legendre and Jacobi polynomials.

Problem: Represent the partial derivatives of $\varphi_{i,j}(x, y)$ in the basis (i.e., as linear combinations of shifts of the $\varphi_{i,j}(x, y)$ itself).

Solution

Ansatz: One needs a relation of the form

$$\sum_{(k,l) \in A} a_{k,l}(i,j) \frac{d}{dx} \varphi_{i+k,j+l}(x,y) = \sum_{(m,n) \in B} b_{m,n}(i,j) \varphi_{i+m,j+n}(x,y),$$

that is free of x and y (and similarly for $\frac{d}{dy}$).

Solution

Ansatz: One needs a relation of the form

$$\sum_{(k,l) \in A} a_{k,l}(i,j) \frac{d}{dx} \varphi_{i+k,j+l}(x,y) = \sum_{(m,n) \in B} b_{m,n}(i,j) \varphi_{i+m,j+n}(x,y),$$

that is free of x and y (and similarly for $\frac{d}{dy}$).

Result: Computer algebra methods (D-finite closure properties, Gröbner bases), deliver the relation

$$\begin{aligned} & (2i + j + 3)(2i + 2j + 7) \frac{d}{dx} \varphi_{i,j+1}(x,y) + \\ & 2(2i + 1)(i + j + 3) \frac{d}{dx} \varphi_{i,j+2}(x,y) - \\ & (j + 3)(2i + 2j + 5) \frac{d}{dx} \varphi_{i,j+3}(x,y) + \\ & (j + 1)(2i + 2j + 7) \frac{d}{dx} \varphi_{i+1,j}(x,y) - \\ & 2(2i + 3)(i + j + 3) \frac{d}{dx} \varphi_{i+1,j+1}(x,y) - \\ & (2i + j + 5)(2i + 2j + 5) \frac{d}{dx} \varphi_{i+1,j+2}(x,y) + \\ & 2(i + j + 3)(2i + 2j + 5)(2i + 2j + 7) \varphi_{i,j+2}(x,y) + \\ & 2(i + j + 3)(2i + 2j + 5)(2i + 2j + 7) \varphi_{i+1,j+1}(x,y) = 0. \end{aligned}$$

Creative Telescoping

Method for doing integrals and sums
(aka Feynman's differentiating under the integral sign)

Consider the following summation problem: $F(n) := \sum_{k=a}^b f(n, k)$

Creative Telescoping

Method for doing integrals and sums
(aka Feynman's differentiating under the integral sign)

Consider the following summation problem: $F(n) := \sum_{k=a}^b f(n, k)$

Telescoping: write $f(n, k) = g(n, k + 1) - g(n, k)$.

Creative Telescoping

Method for doing integrals and sums
(aka Feynman's differentiating under the integral sign)

Consider the following summation problem: $F(n) := \sum_{k=a}^b f(n, k)$

Telescoping: write $f(n, k) = g(n, k + 1) - g(n, k)$.

Then $F(n) = \sum_{k=a}^b (g(n, k + 1) - g(n, k)) = g(n, b + 1) - g(n, a)$.

Creative Telescoping

Method for doing integrals and sums
(aka Feynman's differentiating under the integral sign)

Consider the following summation problem: $F(n) := \sum_{k=a}^b f(n, k)$

Telescoping: write $f(n, k) = g(n, k + 1) - g(n, k)$.

Then $F(n) = \sum_{k=a}^b (g(n, k + 1) - g(n, k)) = g(n, b + 1) - g(n, a)$.

Creative Telescoping: write

$$c_r(n)f(n + r, k) + \cdots + c_0(n)f(n, k) = g(n, k + 1) - g(n, k).$$

Creative Telescoping

Method for doing integrals and sums
(aka Feynman's differentiating under the integral sign)

Consider the following summation problem: $F(n) := \sum_{k=a}^b f(n, k)$

Telescoping: write $f(n, k) = g(n, k + 1) - g(n, k)$.

Then $F(n) = \sum_{k=a}^b (g(n, k + 1) - g(n, k)) = g(n, b + 1) - g(n, a)$.

Creative Telescoping: write

$$c_r(n)f(n + r, k) + \cdots + c_0(n)f(n, k) = g(n, k + 1) - g(n, k).$$

Summing from a to b yields a recurrence for $F(n)$:

$$c_r(n)F(n + r) + \cdots + c_0(n)F(n) = g(n, b + 1) - g(n, a).$$

Creative Telescoping

Method for doing integrals and sums
(aka Feynman's differentiating under the integral sign)

Consider the following integration problem: $F(x) := \int_a^b f(x, y) \, dy$

Telescoping: write $f(x, y) = \frac{d}{dy}g(x, y)$.

Then $F(x) = \int_a^b \left(\frac{d}{dy}g(x, y) \right) \, dy = g(x, b) - g(x, a)$.

Creative Telescoping: write

$$c_r(x) \frac{d^r}{dx^r} f(x, y) + \cdots + c_0(x) f(x, y) = \frac{d}{dy}g(x, y).$$

Integrating from a to b yields a differential equation for $F(x)$:

$$c_r(x) \frac{d^r}{dx^r} F(x) + \cdots + c_0(x) F(x) = g(x, b) - g(x, a)$$

Table of Integrals by Gradshteyn and Ryzhik

Table of Integrals by Gradshteyn and Ryzhik

Table of Integrals by Gradshteyn and Ryzhik

The image displays a comprehensive table of integrals, organized into columns and rows. Each entry typically includes a mathematical expression involving variables like x , a , b , c , and n , and a corresponding integral result. The formulas cover a wide range of functions, including trigonometric, exponential, logarithmic, and special functions. The table is densely packed with mathematical notation, including subscripts, superscripts, and various symbols like Γ , ζ , and ψ .

Key features of the table include:

- Columns:** Each column represents a different class of integrals, often starting with a specific function or variable.
- Rows:** Each row contains multiple related integral formulas, often showing different forms or special cases of the same integral.
- Mathematical Notation:** The use of Greek letters, subscripts, and superscripts is extensive, indicating the complexity of the formulas.
- Structure:** The table is organized into a grid, with each entry clearly separated from the others by thin lines.

The table is a valuable resource for mathematicians, physicists, and engineers, providing a wide range of integral formulas for reference and calculation.

Here we consider the reference domain $\hat{\Omega} = (-1, 1)^2$ with

$$(u, v)_{X(\hat{\Omega})} = \int_{\hat{\Omega}} \partial_x u(x, y) \partial_x v(x, y) \, dx \, dy,$$

$$(u, v)_{Y(\hat{\Omega})} = \int_{\hat{\Omega}} u(x, y) v(x, y) \, dx \, dy,$$

for $u, v \in \hat{V}_n$, where \hat{V}_n is the space of polynomials of degree less than n , i.e.

$$\hat{V}_n = \{x^i y^j : 0 \leq i, j < n\}.$$

The desired “constant” $\hat{c}(n)$ can be found as the largest λ_n solving the generalized eigenvalue problem

$$B_n \vec{x}_n = \lambda_n A_n \vec{x}_n,$$

where A_n and B_n are certain $n \times n$ matrices.

Theorem: For all $n \in \mathbb{N}$ we have the estimate $b_1(n) < \lambda_n < b_2(n)$ with

$$b_1(n) := \frac{m_1(n)}{2} \left(1 + \sqrt{1 - \frac{2}{3} \frac{(n-2)(n-3)(n+3)(n+4)}{n(n-1)(n+1)(n+2)}} \right),$$
$$b_2(n) := m_1(n) \left(\frac{1}{3} + \left(r_1(n) + \sqrt{r_2(n)} \right)^{1/3} + \left(r_1(n) - \sqrt{r_2(n)} \right)^{1/3} \right),$$

Final Result

Theorem: For all $n \in \mathbb{N}$ we have the estimate $b_1(n) < \lambda_n < b_2(n)$ with

$$b_1(n) := \frac{m_1(n)}{2} \left(1 + \sqrt{1 - \frac{2}{3} \frac{(n-2)(n-3)(n+3)(n+4)}{n(n-1)(n+1)(n+2)}} \right),$$
$$b_2(n) := m_1(n) \left(\frac{1}{3} + \left(r_1(n) + \sqrt{r_2(n)} \right)^{1/3} + \left(r_1(n) - \sqrt{r_2(n)} \right)^{1/3} \right),$$

where m_1 , r_1 , and r_2 are given by

$$m_1(n) := \frac{n(n-1)(n+1)(n+2)}{8},$$
$$r_1(n) := \frac{2(n^8 + 4n^7 + 8n^6 + \dots - 4733n^2 - 5130n + 16200)}{135n^2(n-1)^2(n+1)^2(n+2)^2},$$
$$r_2(n) := \frac{(n-2)(n-3)(n+4)(n+3)(7n^{12} + 42n^{11} + \dots)}{145800n^4(n-1)^4(n+1)^4(n+2)^4}.$$
